

Project Initialization and Planning Phase

Date	6 July 2026
Team ID	xxxxxxx
Project Name	Credit Card Approval Prediction System
Maximum Marks	3 Marks

Define Problem Statements:

A problem statement helps us understand the challenges faced by users before developing a solution. For our Credit Card Approval Prediction System, we identified the problems experienced by applicants and bank officials during the credit card approval process. These problem statements helped us understand user requirements and guided the development of an efficient machine learning solution.

Example:

Problem Statement	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1	An individual applying for a credit card.	Know whether my credit card application is likely to be approved before applying.	I am unsure which financial and personal factors affect the approval decision.	Different banks follow different eligibility criteria, and I don't receive clear feedback.	Confused and worried about whether my application will be accepted.
PS-2	A bank employee reviewing credit card applications.	Evaluate customer applications quickly and accurately.	Manual verification takes time and increases workload.	A large number of applications must be checked every day.	Pressured to make accurate decisions in a limited amount of time.
PS-3	A first-time credit card applicant.	Understand my chances of approval and improve my eligibility.	I don't know which factors reduce my approval chances.	Credit approval depends on income, employment, assets, and credit history.	Uncertain and anxious before submitting my application.

Conclusion

The identified problem statements helped our team understand the needs of both applicants and bank officials. These insights guided the development of a machine learning–based Credit Card Approval Prediction System that provides faster, more consistent, and data-driven approval predictions.
